

# ADD A SUBWOOFER TO A FULL-RANGE SOUND SYSTEM

Crossover Module Allows Mono Amplifier to Drive a Passive Subwoofer

## Description:

The RDL ST-CX2S Subwoofer Crossover Filter provides active line-level equalization for the addition of a subwoofer to a sound system equipped with full-range speakers.

The ST-CX2S high-impedance line-level stereo inputs bridge existing line-level stereo sources. Each input is isolated to prevent the introduction of any crosstalk to an existing stereo signal. The low impedance (150Ω) line-level output can drive low or high impedance lines. Inputs and output may be wired balanced or unbalanced.
