

ELIMINATE AUDIO HUM IN A GROUP PRESENTATION

Galvanic Isolation for Stereo Audio Ground Loop or Computer Digital Noise

AV-HK1
"HUM KILLER" Stereo Audio Isolation Transformer -
Dual RCA inputs and outputs

Description:

Presentations using a laptop computer face problems of delivering quality audio through an unbalanced connection. Any difference in ground potential between the computer and audio amplifier creates "hum" that becomes part of the presentation audio. In some systems, digital noise from the computer may also add a constant irritating background noise to the audio.

The RDL AV-HK1 easily solves this common problem. The AV-HK1 breaks the ground path for "hum" and digital noise using stereo audio isolation transformers in a rugged, tightly shielded enclosure.

The AV-HK1 "Hum Killer" is a must-have item for the touring presenter and is equally useful in a fixed AV installation.
